DRAGONFLY
DIGITAL SUPPLY CHAIN EXPERTS

SwiftConfirmation

- Eliminate Manual Inefficiencies
- Accelerate Order Processing
- Improve Cost Accuracy

DRAGONFLY
DIGITAL SUPPLY CHAIN EXPERTS

SwiftConfirmation

Overview

SwiftConfirmation for SAP revolutionises production order confirmations by automating serial-level tracking, capturing real-time machine and labour data, and integrating quality checks—all in a single interface.

Available now on the SAP Store, this solution helps you to eliminate manual inefficiencies, accelerate your order processing and enhance cost accuracy.

With SwiftConfirmation for SAP you can empower smarter, data-driven manufacturing for higher efficiency and productivity

SwiftConfirmation

Seamless Production & Instant Assurance

DRAGONFLY
DIGITAL SUPPLY CHAIN EXPERTS

Challenges	Solution
Manual Intervention & Inefficiencies • Operators manually confirm production orders, leading to delays / errors. • No serial number-wise confirmation, making tracking difficult.	**Automated Scanning for Serial Number Confirmation** • Implement barcode/RFID scanning at operation start and end. • Automatically confirm production orders serial number-wise in SAP.
Inaccurate Time Tracking • No direct way to capture exact machine and labour time for each unit. • Inefficiency in cost calculations due to estimated time usage.	**Real-time Machine & Labor Time Tracking** • Start and end time for each unit is captured at scanning. • Automatically calculates actual time spent, improving cost accuracy.
Multiple Screens & Complexity • Users need to navigate multiple SAP screens for confirmations, inspections and time entry. • This increases chances of missing data or making mistakes.	**Single Unified Screen for Operators** • All necessary data (order confirmation, serial number, quality inspection) available on a single interface. • User-friendly UI design for quick interactions, reducing manual errors.
Lack of Real-time Quality Inspection Data • Quality checks are performed separately, delaying defect detection. • No direct link between production confirmation and quality results.	**In-Process Quality Inspections at Scan-Out** • Quality check recorded at scan-out, ensuring real-time defect tracking. • Eliminates the need to switch between multiple SAP screens.

Solution Benefits

DRAGONFLY
DIGITAL SUPPLY CHAIN EXPERTS

Accelerated Daily Order Confirmations

Process automation drastically reduces delays and bottlenecks. By eliminating manual dependencies and enabling real-time scan-in and scan-out. Production teams can confirm more orders in less time, accelerating throughput and improving on-time delivery performance.

Reduced Manual Effort

Serial number-based scanning and a unified interface means your operators no longer need to toggle between multiple SAP screens or manually input data. This not only reduces workload but also reduces the risk of human error and frees up time for more value-added tasks.

Increased Operator Productivity

Streamlined workflows, intuitive design and automation enables operators to focus on actual production activities. Real-time feedback on production progress and built-in quality checks further reduces downtime and enables faster, more confident execution.

Improved Cost Precision

Scan-based tracking helps capture exact start and end times per unit enabling precise data for calculating actual labour and machine usage. This replaces estimated costing with real figures, improving cost control and enabling better forecasting and financial planning.

Minimised Rework and Scrap

In-process quality inspection at the point of scan-out ensures that defects are identified immediately - and corrective action can be taken immediately. This proactive approach improves first-pass yield, enhances product quality and significantly reduces material waste and rework cycles.

Outcomes

SwiftConfirmation for SAP has shown significant tangible and measurable benefits including:

- 15% increase in Order Confirmations per day – by using automation to speed up the confirmation process.
- 50-70% Reduction in Manual Effort – by eliminating redundant data entry and reduced screen navigation.
- 2x Improvement in Operator Productivity – by streamlining workflows for faster execution.
- 95% Accuracy in Machine & Labour Costing – by remove estimation errors through real-time tracking.
- 20-30% Reduction in Rework & Scrap – through early defect detection which enhances product quality and minimises waste.

These enhancements drive higher efficiency, cost savings and smarter production planning.
